    2.1. Data Gathering
        2.1.1. Data collection
        2.1.2. Initial data review 2.2. Phase
    2.1 Data Preparation
        2.2.1. data cleaning
        2.2.2 data transformation
        2.2.3 schema design
    2.3 Data Visualization
    2.4 Interpretation
3. Conclusion & Challenges

1. Introduction

This BI report analyzes **digital payment adoption in Tunisia** via Flouci, a local digital wallet platform. The project aims to provide **data-driven insights** into user behavior, transaction patterns, and wallet performance to guide marketing, product optimization, and retention strategies.

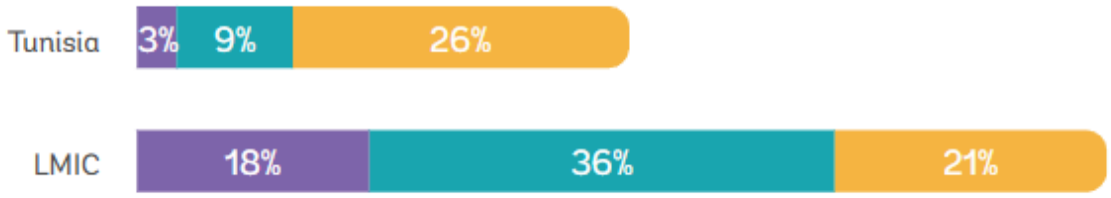

Key focus areas:

- **Customer Behavior**: Age, gender, income, education, wallet type, tenure, and attrition
- **Transaction Patterns**: Amounts, frequency, wallet tiers, and regional distribution
- **Strategic Decisions**: Insights to improve adoption and retention

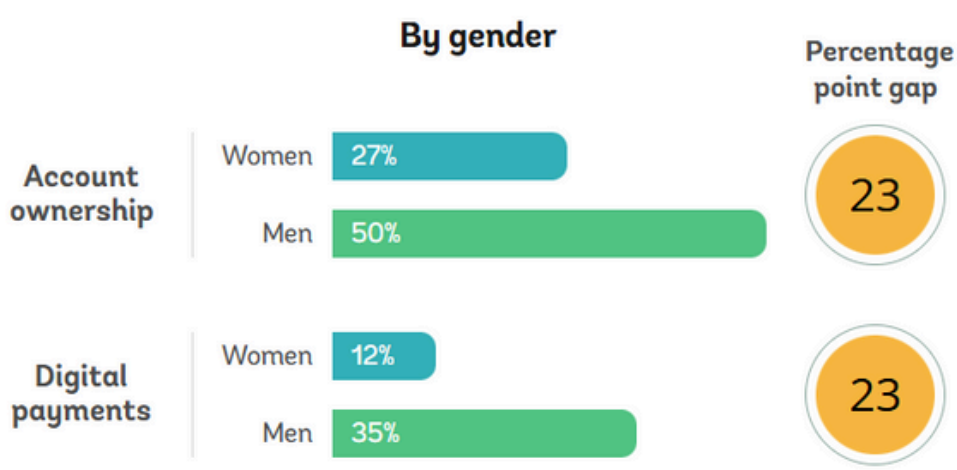

Objectives:

- Analyze adoption trends across customer segments
- Identify high-risk customers with potential attrition
- Evaluate wallet tier performance
- Provide actionable recommendations for Flouci management

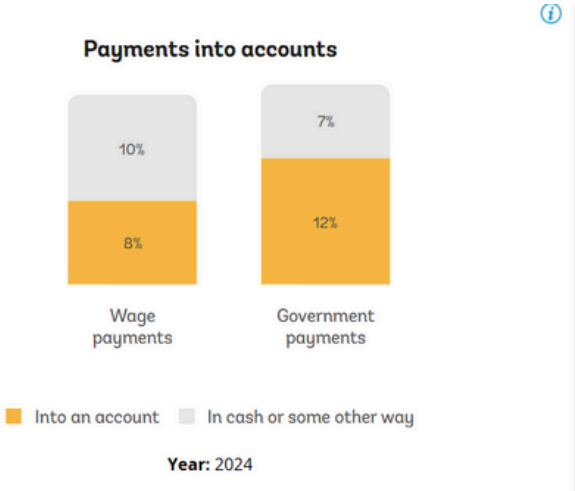

1. Introduction

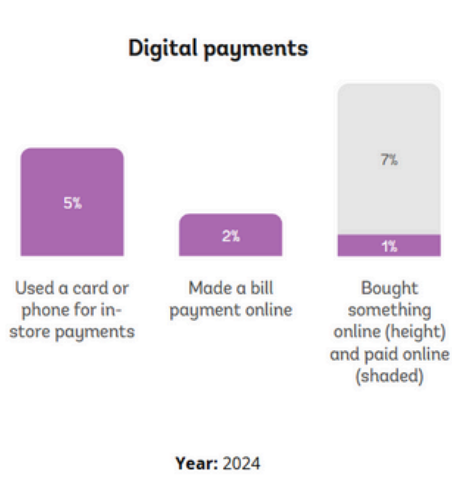

- Have a mobile money account
- Have only a bank or similar financial institution account and make digital payments from it using a card or phone
- Have only a bank or similar financial institution account but do not make digital payments from it

Year: 2024

Year: 2024

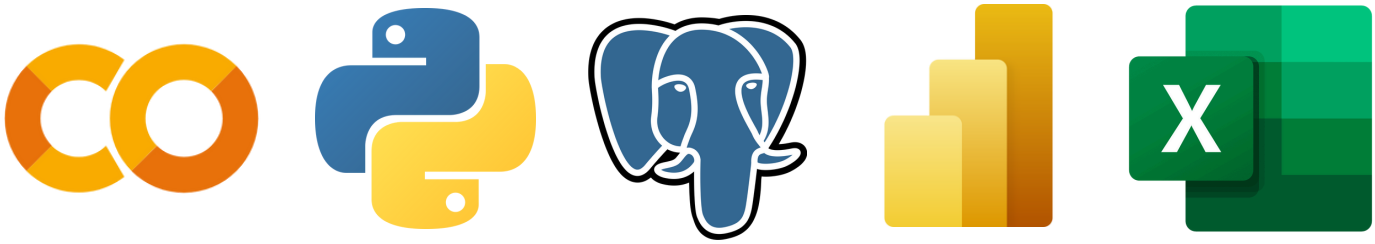

Year: 2024

2. Implementation

2.1 Data Gathering

Software Used:

2.1.1 Data Collection

Data sourced from anonymized Flouci transactions (~10,000 records), including:
customer_id, age, gender, income_category, education_level, wallet_category, customer_tenure_months, transaction_amount, transaction_count, attrition_flag
The dataset was adapted to the Tunisian context using World Bank financial inclusion data.

Drive / GitHub Link: (Inserted here)

2.1.2 Initial Data Review :

- Explored dataset structure and data types
- Identified missing values and outliers
- Checked categorical distributions (gender, wallet type, income, education)

2.2 Data Preparation

2.1 Data Gathering

22	806165208	Existing Customer	47	M	1	Graduate	Divorced	$60K - $80K	Blue	42	1178	27
23	708508758	Attrited Customer	62	F	0	Graduate	Married	Less than $40K	Blue	49	692	16
24	784725333	Existing Customer	41	M	3	High School	Married	$40K - $60K	Blue	33	931	18
25	811604133	Existing Customer	47	F	4	Unknown	Single	Less than $40K	Blue	36	1126	23
26	789124683	Existing Customer	54	M	2	Unknown	Married	$80K - $120K	Blue	42	1110	21
27	771071958	Existing Customer	41	F	3	Graduate	Single	Less than $40K	Blue	28	1051	22
28	720466383	Existing Customer	59	M	1	High School	Unknown	$40K - $60K	Blue	46	1197	23
29	804424383	Existing Customer	63	M	1	Unknown	Married	$60K - $80K	Blue	56	1904	40
30	718813833	Existing Customer	44	F	3	Unknown	Single	Unknown	Blue	34	1052	18
31	806624208	Existing Customer	47	M	4	High School	Married	$40K - $60K	Blue	42	1045	38
32	778348233	Existing Customer	53	M	3	Unknown	Married	$80K - $120K	Blue	33	1038	25
33	712991808	Existing Customer	53	M	2	Unknown	Married	$60K - $80K	Blue	48	1596	26

The dataset was then cleaned and standardized using Microsoft Excel, where irrelevant columns were removed, categorical values were unified, and data quality checks were performed to ensure consistency and reliability.

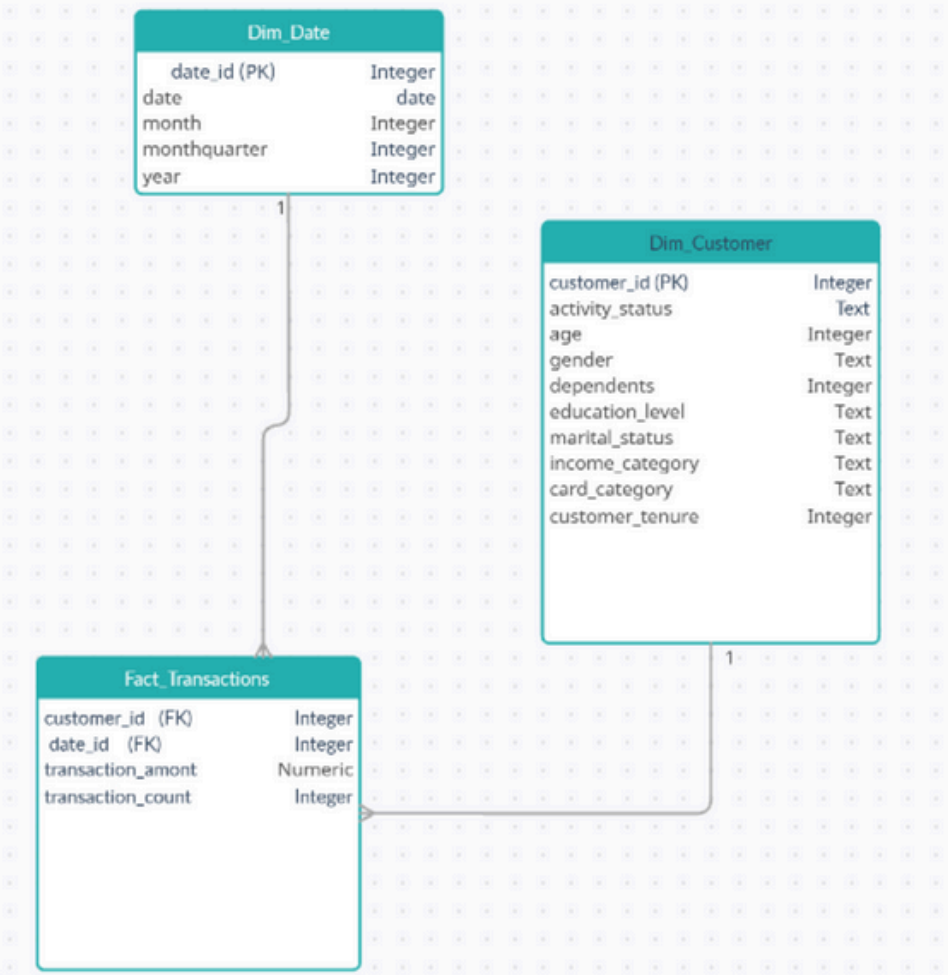

2.2 Data Preparation

Column Name	Description	Data Type	Example
customer_id	Unique identifier for each customer	Integer	769000123
activity_status	Indicates wether the customer is active or inactive in digital payments	Text	Active
age	customer age	Integer	45
gender	customer gender	Text	M
dependents	number of dependents	Integer	2
education_level	customer education category	Text	Graduate
marital_status	customer marital category	Text	Married
income_category	customer income range	Text	$60K-$80K
card_category	type of bank card	Text	Gold
customer_tenure_months	number of months as a customer	Integer	36
transaction_amount	total amount of digital payment transactions	Numeric	12450
transaction_count	number of digital payment transactions	Integer	85

The data dictionary provides a detailed description of each variable used in the analysis, including its definition, data type, and an example value. It serves as a reference to ensure a clear understanding of the dataset structure and to maintain consistency during data preparation, analysis, and dashboard development.

2.2.3 Schema Design

Dimensional Star Schema:

Fact Table:

- fact_transactions → transaction_id, customer_id, date_id, transaction_amount, transaction_count

Dimension Tables:

- dim_customer → customer_id, age, gender, income_category, education_level, marital_status, wallet_category, customer_tenure
- dim_date → date_id, date, month, quarter, year
- dim_product → wallet_category, product_features

Implementation PROJECT

1. Creation FACT/DIMENSION tables :

```
# Create Customer Dimension
customer_dim = bank_df.loc[:, [
    'customer_id',
    'activity_status',
    'age',
    'gender',
    'dependents',
    'education_level',
    'marital_status',
    'income_category',
    'card_category',
    'customer_tenure_months'
]].copy()

# Drop duplicate customers
customer_dim.drop_duplicates(subset='customer_id', inplace=True)

# Reset index
customer_dim.reset_index(drop=True, inplace=True)
```

```
import pandas as pd

# Convert transaction_date to datetime
bank_df['transaction_date'] = pd.to_datetime(bank_df['transaction_date'])

# Create Date Dimension
date_dim = bank_df[['transaction_date']].drop_duplicates()

# Extract date parts
date_dim['year'] = date_dim['transaction_date'].dt.year
date_dim['quarter'] = date_dim['transaction_date'].dt.quarter
date_dim['month'] = date_dim['transaction_date'].dt.month
date_dim['day'] = date_dim['transaction_date'].dt.day

# Reset index
date_dim.reset_index(drop=True, inplace=True)
```

```
# Create Fact Transactions table
fact_transactions = bank_df.loc[:, [
    'customer_id',
    'transaction_amount',
    'transaction_count'
]].copy()

# Reset index
fact_transactions.reset_index(drop=True, inplace=True)
```

2. Export CSV files

3.Create dimensions/fact tables in the DB

```
-- 1. Create the database
CREATE DATABASE bank_transactions;
```

```
-- 3. Create Dim_Date table
CREATE TABLE Dim_Date (
    date_id SERIAL PRIMARY KEY,
    date DATE NOT NULL UNIQUE,                -- each date should be unique
    month INTEGER NOT NULL CHECK (month BETWEEN 1 AND 12),
    monthquarter INTEGER NOT NULL CHECK (monthquarter BETWEEN 1 AND 4),
    year INTEGER NOT NULL CHECK (year > 1900)    -- assuming realistic years
);
```

```
-- 4. Create Dim_Customer table
CREATE TABLE Dim_Customer (
    customer_id SERIAL PRIMARY KEY,
    activity_status TEXT NOT NULL CHECK (activity_status IN ('Active','Inactive')),
 -- only valid statuses
    age INTEGER NOT NULL CHECK (age >= 0),        -- no negative ages
    gender TEXT CHECK (gender IN ('Male','Female','Other')),  -- optional
    dependents INTEGER DEFAULT 0 CHECK (dependents >= 0),
    education_level TEXT,
    marital_status TEXT CHECK (marital_status IN
('Single','Married','Divorced','Widowed')),
    income_category TEXT,
    card_category TEXT,
    customer_tenure INTEGER DEFAULT 0 CHECK (customer_tenure >= 0)
);
```

```
-- 5. Create Fact_Transactions table
CREATE TABLE Fact_Transactions (
    transaction_id SERIAL PRIMARY KEY,
    customer_id INTEGER NOT NULL REFERENCES Dim_Customer(customer_id) ON DELETE
CASCADE,
    date_id INTEGER NOT NULL REFERENCES Dim_Date(date_id) ON DELETE CASCADE,
    transaction_amount NUMERIC(10,2) NOT NULL CHECK (transaction_amount >= 0),
    transaction_count INTEGER NOT NULL DEFAULT 1 CHECK (transaction_count >= 0)
);
```

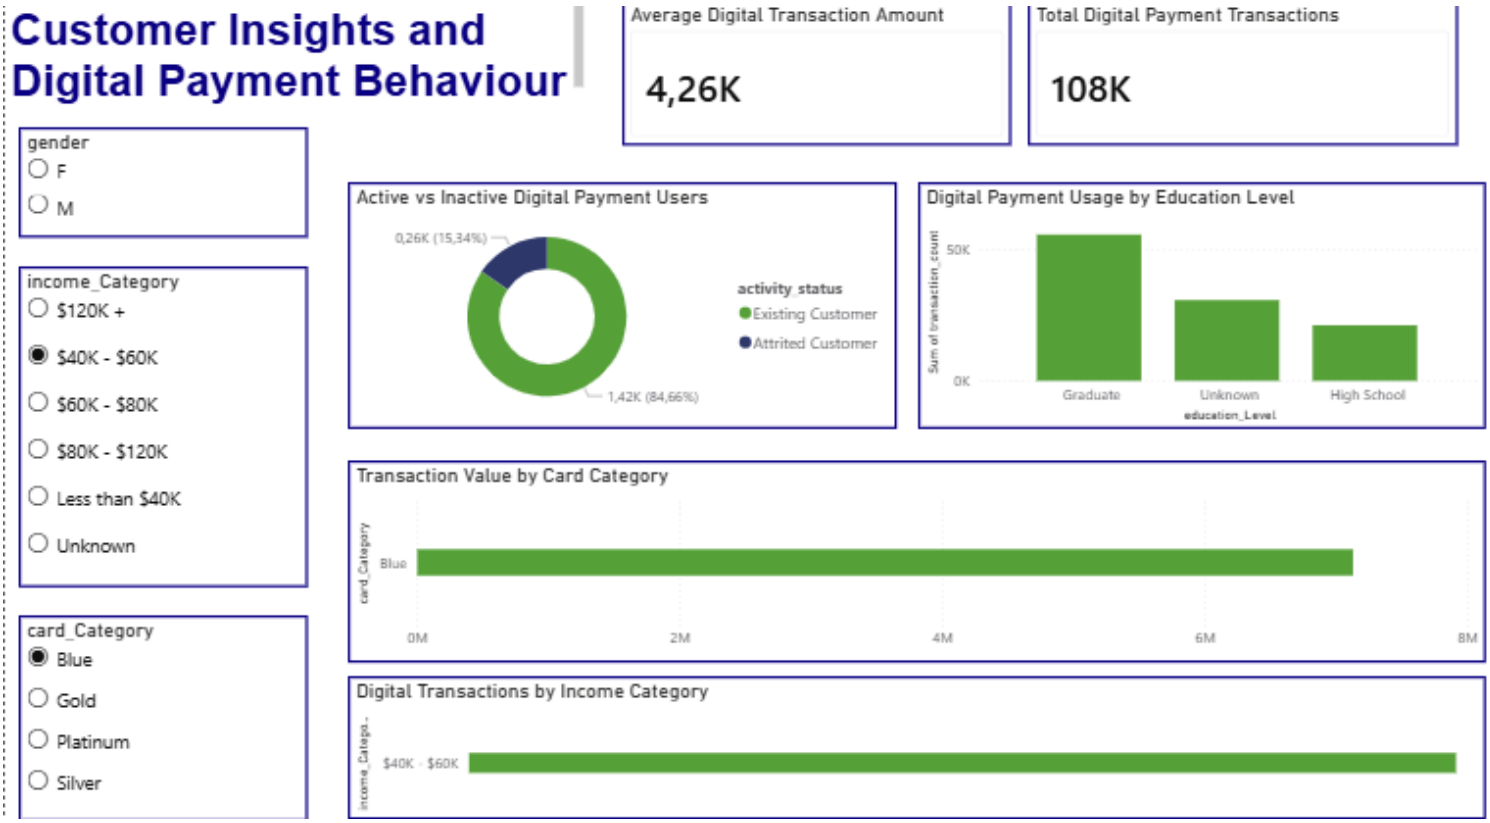

Implementation PROJECT

Defined Measures:

Measure Name	Formula / Calculation	Description / Business Meaning
Total Transaction Amount	SUM(transaction_amount)	Total amount of digital payment transactions across all customers.
Total Transaction Count	SUM(transaction_count)	Total number of digital payment transactions.
Average Transaction Amount	AVG(transaction_amount)	Average value per transaction; shows typical transaction size.
Average Transactions per Customer	AVG(transaction_count)	Average number of transactions per customer; shows customer engagement.
Active Customer Count	COUNT([customer_id]) WHERE activity_status = 'Active'	Number of active customers using digital payments.
YOY Transaction Growth	(total transaction_amount this year - last year) / last	Year-over-year growth in transaction value.
MOM Transaction Growth	(total transaction_amount this month - last month) / last month	Month-over-month growth in transaction value.
Average Customer Tenure	AVG(customer_tenure_months)	Average duration (in months) customers have been active; indicates loyalty.
High-Value Customers	COUNT([customer_id]) WHERE transaction_amount >	Number of customers making high-value payments (VIP segment).
Low Activity Customers	COUNT([customer_id]) WHERE transaction_count < 5	Customers with very few transactions; potential churn risk.
Top Income Segment Revenue	SUM(transaction_amount) WHERE income_category = '$80k+'	Revenue contributed by the highest income segment; shows premium value.
Card Category Share	DIVIDE(SUM(transaction_amount), SUM(Card_Category_SUM(transaction_amount)))	Percentage of revenue per card type (Gold, Silver, etc.); highlights card performance
Gender-Based Transaction Split	DIVIDE(SUM(transaction_amount), SUM(transaction_amount)) by gender, SUM(transaction_amount_amount)	Shows which gender contributes more to digital payments; useful for targeting.
Average Transaction per Tenure Month	SUM(transaction_amount) / SUM(customer_tenure_months)	Average revenue generated per month of customer tenure; measures loyalty efficiency.
Dependents vs Transaction	SUM(transaction_amount) / AVG(dependents + 1)	Insight into how family size correlates with transaction volume.

This table summarizes the key performance indicators (KPIs) used to evaluate digital payment adoption and customer behavior. Each KPI is defined with its calculation method and business meaning, ensuring transparency and consistency in the analysis. These indicators support the project use case by measuring transaction volume, customer activity, demographic impact, and card usage, which are essential for assessing the current state of digital payments and identifying areas for improvement in the Tunisian context.

2.3 Data Visualization

The dashboard highlights key patterns in **digital payment adoption.** The results show a high level of digital transaction activity, with a large number of transactions and a consistent average transaction value. Most customers are active users, indicating a positive adoption trend, while a smaller inactive segment suggests potential for improvement.

Digital payment usage is higher among customers with **graduate-level education and middle-income categories,** showing that education and income influence adoption. In addition, standard bank cards generate the majority of transaction value, confirming that digital payments are mainly **driven by mass-market customers.**

Conclusion and Challenges PROJECT

This project addressed the challenge of **improving digital payment adoption in Tunisia** by analyzing **customer behavior and transaction patterns** through a Business Intelligence approach. Using a structured ETL process and an interactive dashboard, the analysis highlighted key factors influencing adoption, such as education level, income category, and card usage. The results support the use case by showing that digital payments are mainly driven by **mass-market users**, while certain customer segments remain underrepresented, indicating opportunities for targeted improvement strategies.

Despite these insights, the project faced several challenges. The primary limitation was the lack of real, detailed local datasets related to Tunisian digital wallets and banking restrictions, which required the use of alternative data and assumptions. Additionally, data cleaning and standardization were necessary to ensure analytical reliability. Nevertheless, the project provides a relevant analytical framework that can be applied to real Tunisian digital payment systems to support future adoption and decision-making.
